Behodler UI

The UI for Behodler is divided into a swap page and a dapps subdomain. This project is exclusively concerned with the swap sectiom

Developers

If you would like to submit a pull request, it's required that you test and run the dapp through the docker containers specified in docker-compose.

To start up the UI container,

```
npm start
```

To tear down the containers

```
npm stop
```

Do not try to install the node_modules manually. Instead run

```
npm run install:docker
```

which will run the container in the specified version of node known to work with the dependencies. It will then populate your local node_modules.
